Ron Aubrey's Garden Shed — O Scale (1:48)

A model such as this provides good practice for building a larger and more complex structure. Can you add the glue tabs, make your cuts straight and even, and your glue joints both secure and neat?

There are more than enough materials on this page to build a basic model from a single printed copy. However a true 3D model requires at least three copies of this page for cutting overlapping lengths of siding, individual louvre panes, etc., as well as a base for assembly.

Score and fold items such as the vertical corner boards before cutting from the surrounding scrap and do all openings, 3D assembly work, etc., prior to folding into the four sided box.

Modified from an O scale garden shed included in one of Ron Aubrey's Queensland cottage kits. It uses commercial detail parts (door) and textures from Clever Models LLC). Print on 210gsm card for best results. This free download from CaneSIG: www.zelmeroz.com/CaneSIG/
