

# GOODS HANDLING

by Jim Fainges

## From Hand truck to Containers

With the exclusion of live stock, logs and minerals which require special equipment all other goods were transported via the goods shed.

### Individual Loads

In the early days of railways goods were transported in individual containers bags, boxes, barrels, cartons, sacks and packages all capable of manual handling at both inward and receiving ends of rail transport larger pieces by a small crane and moved on hand trucks.

### Pallet Loads

later to improve the ease of handling and to protect goods they were palletized or otherwise contained in small containers all capable of being handled by couple of men and maybe a fork lift.

For all this material the goods shed was capable of handling the majority if not all inward and outward goods and to help in unloading larger items and or machinery a crane was provided at most goods sheds to handle the expected loads.

### Containerization

Nowadays goods are moved in bulk in large containers or other bulk containers on specially designed rolling stock and also required special handling equipment at both ends of the trip leading to the demise of the goods shed.

This is a good example to build for a goods shed here are the parts

Drawn by Jim Fainges June 2006

Early in the 1900's drawings were prepared for small station buildings with a goods facility incorporated into the same structure, combined with the station office. Illustrated below is a 25'0" x 10'0" example, and on the next page is shown a 25'0" x 12'0" type. The latter was provided with two roof options, a gable roof for southern districts and a gabled-hip roof for northern areas.
